

# Part 1 – Integration of Selenium

## Installing Selenium libraries

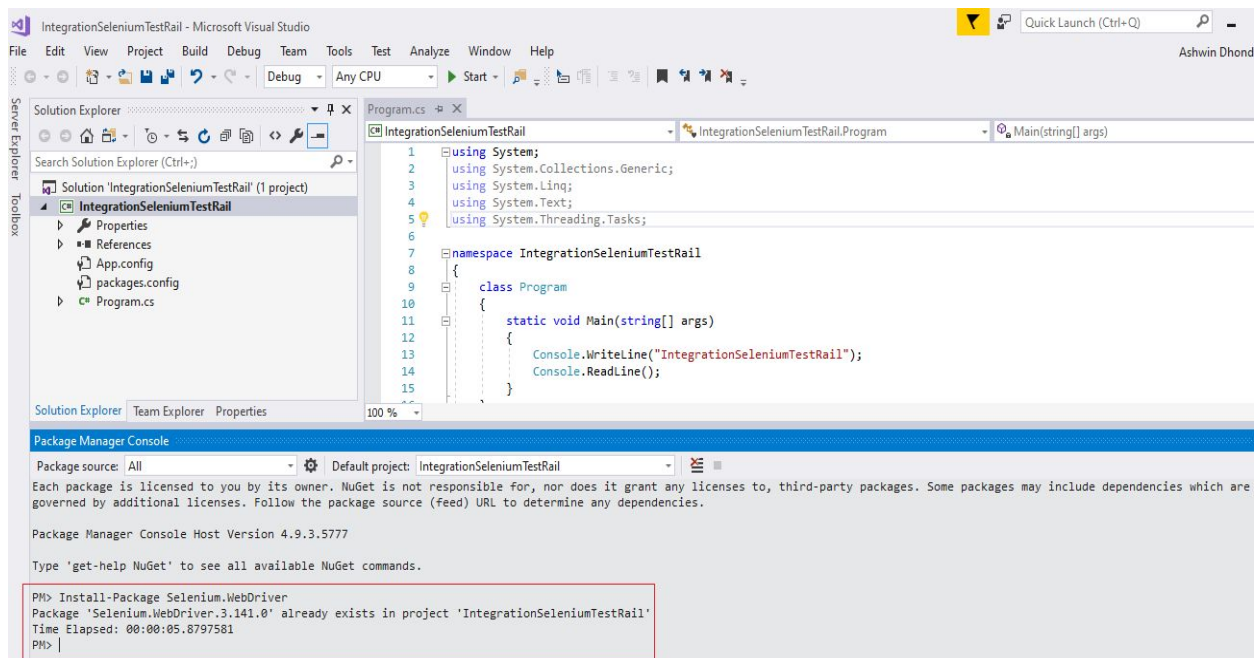

[https://www.selenium.dev/documentation/en/selenium\\_installation/installing\\_selenium\\_libraries/](https://www.selenium.dev/documentation/en/selenium_installation/installing_selenium_libraries/)

### Using package manager

The screenshot shows a web browser displaying the Selenium documentation page for installing Selenium libraries. The page title is "The Selenium Browser Automation Project > Selenium installation > Install...". The content is for C# and states: "Installation of Selenium libraries for C# can be done using NuGet:". Below this, a code block shows the commands to install Selenium.WebDriver using NuGet or .Net CLI:

```
# Using package manager
Install-Package Selenium.WebDriver
# or using .Net CLI
dotnet add package Selenium.WebDriver
```

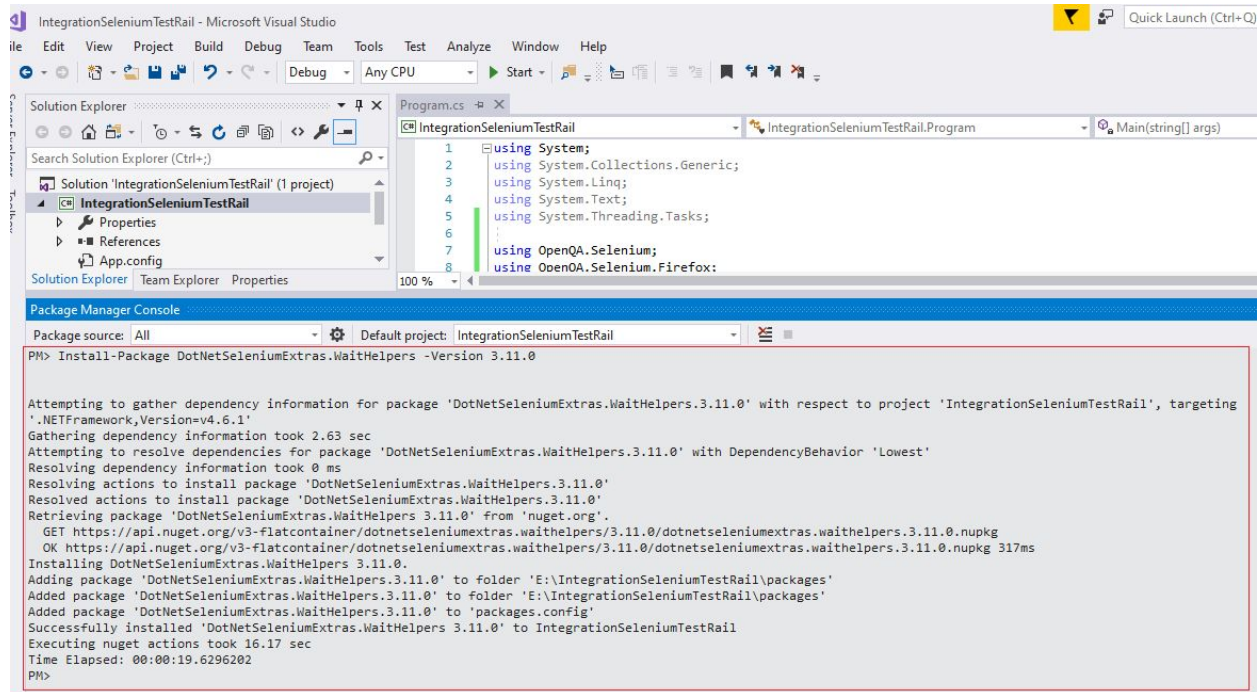

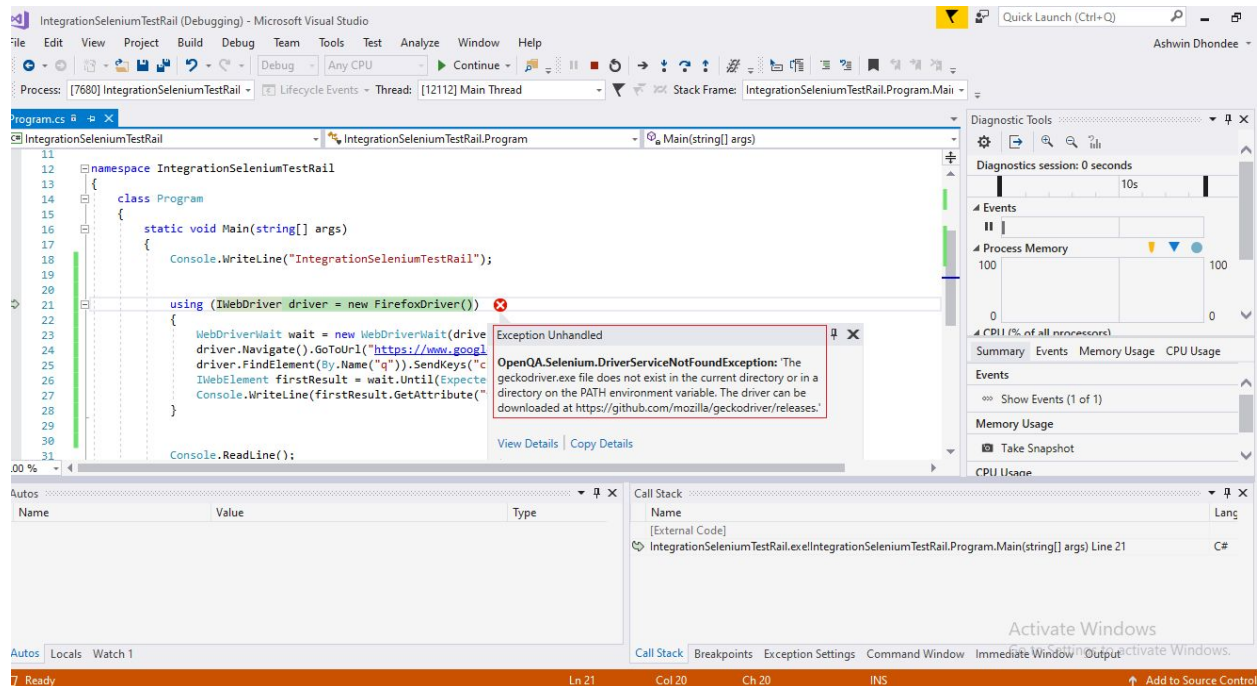

The screenshot shows the Microsoft Visual Studio IDE with a project named "IntegrationSeleniumTestRail". The Solution Explorer on the left shows the project structure. The Package Manager Console at the bottom shows the command "Install-Package Selenium.WebDriver" being executed. The console output indicates that the package "Selenium.WebDriver.3.141.0" already exists in the project.

```
PM> Install-Package Selenium.WebDriver
Package 'Selenium.WebDriver.3.141.0' already exists in project 'IntegrationSeleniumTestRail'
Time Elapsed: 00:00:05.8797581
PM>
```

## Install package DotNetSeleniumExtras

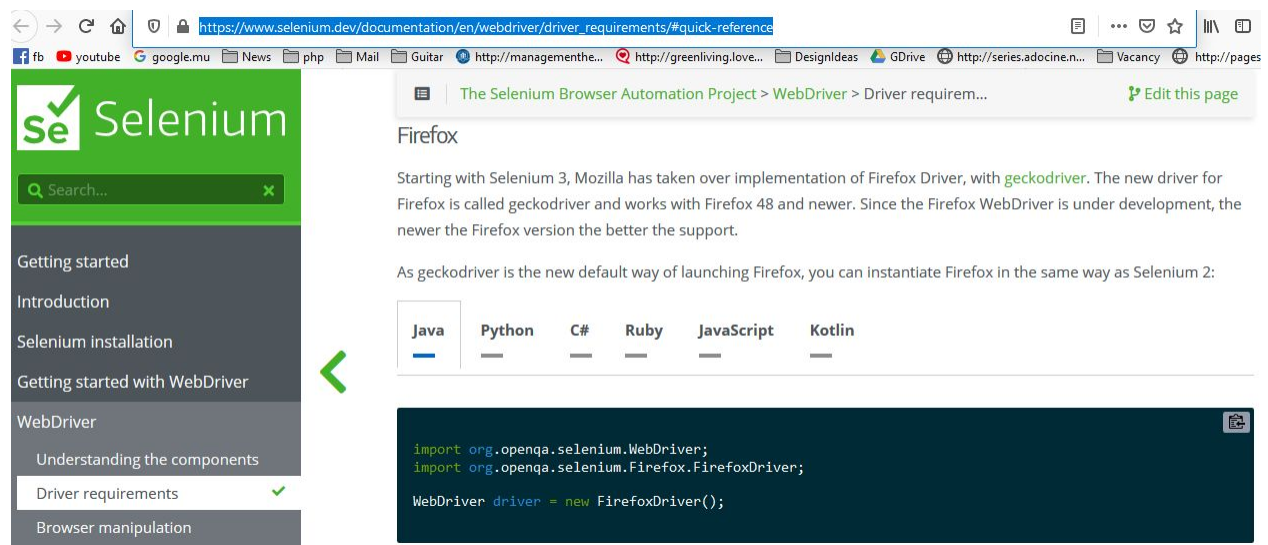

Install-Package DotNetSeleniumExtras.WaitHelpers -Version 3.11.0

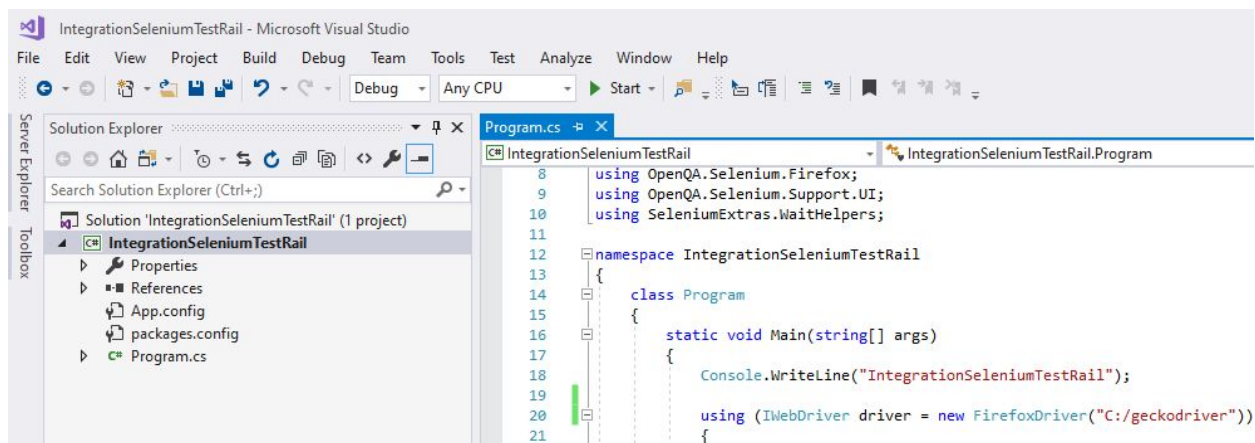

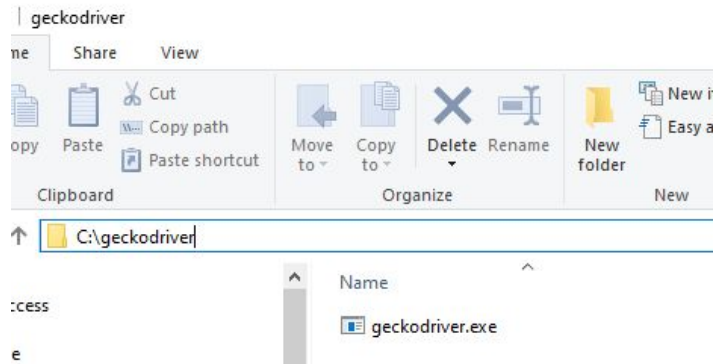

## Installing geckodriver for Firefox

[https://www.selenium.dev/documentation/en/webdriver/driver\\_requirements/#quick-reference](https://www.selenium.dev/documentation/en/webdriver/driver_requirements/#quick-reference)

## Part 2 – Integration with TestRail

Go to <http://docs.gurock.com/testrail-api2/bindings-dotnet>

Download ZIP file containing API bindings and required library.

## API Binding: .NET

The API binding for .NET can be used to access TestRail's API from .NET (for example, C# or VB.NET). It provides the basic functionality to authenticate API requests, provides seamless JSON and UTF-8 encoding/decoding and has generic support for read and write requests. Please see below for several examples on how to use the API binding.

The source code for the binding can be found on [GitHub](#):

[TestRail API binding for .NET \(ZIP\)](#)

The GitHub repository with the API bindings as ZIP download

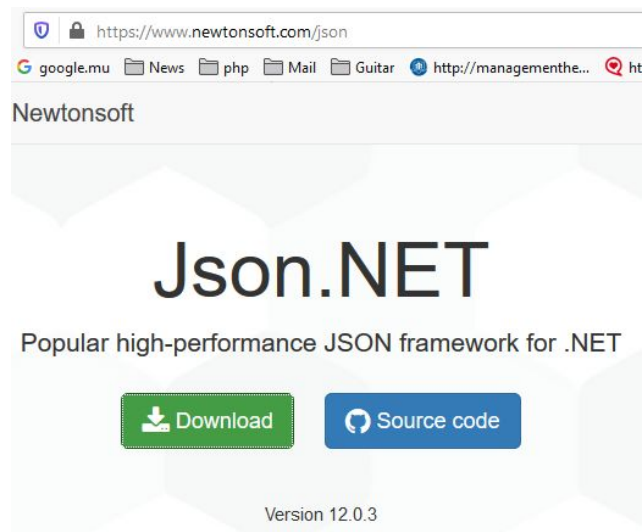

## Setup & installation

Please download the ZIP from the above location and extract it to a directory of your choice. The binding for .NET can be located in the "dotnet" sub-directory. Please add the contained project to your application or project in Visual Studio. The API binding also has a separate, external dependency on the Json.NET library which can be downloaded here:

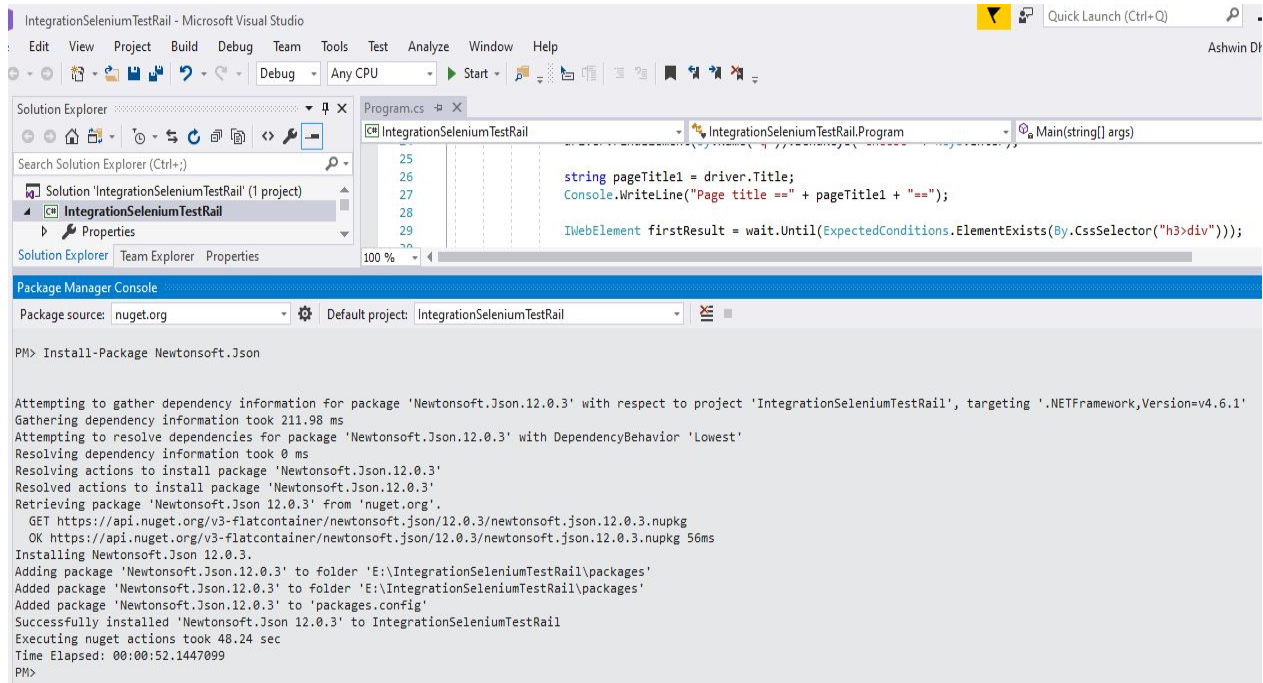

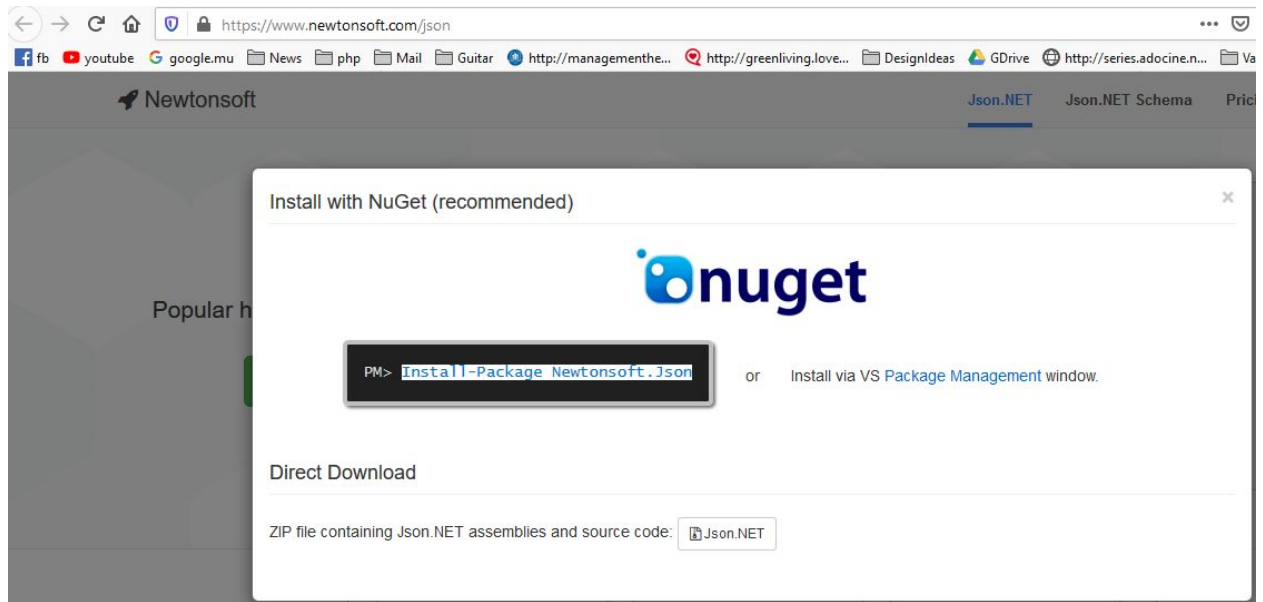

<http://james.newtonking.com/json>

You can then use the API binding as follows:

```
using System;
using System.Collections.Generic;
```

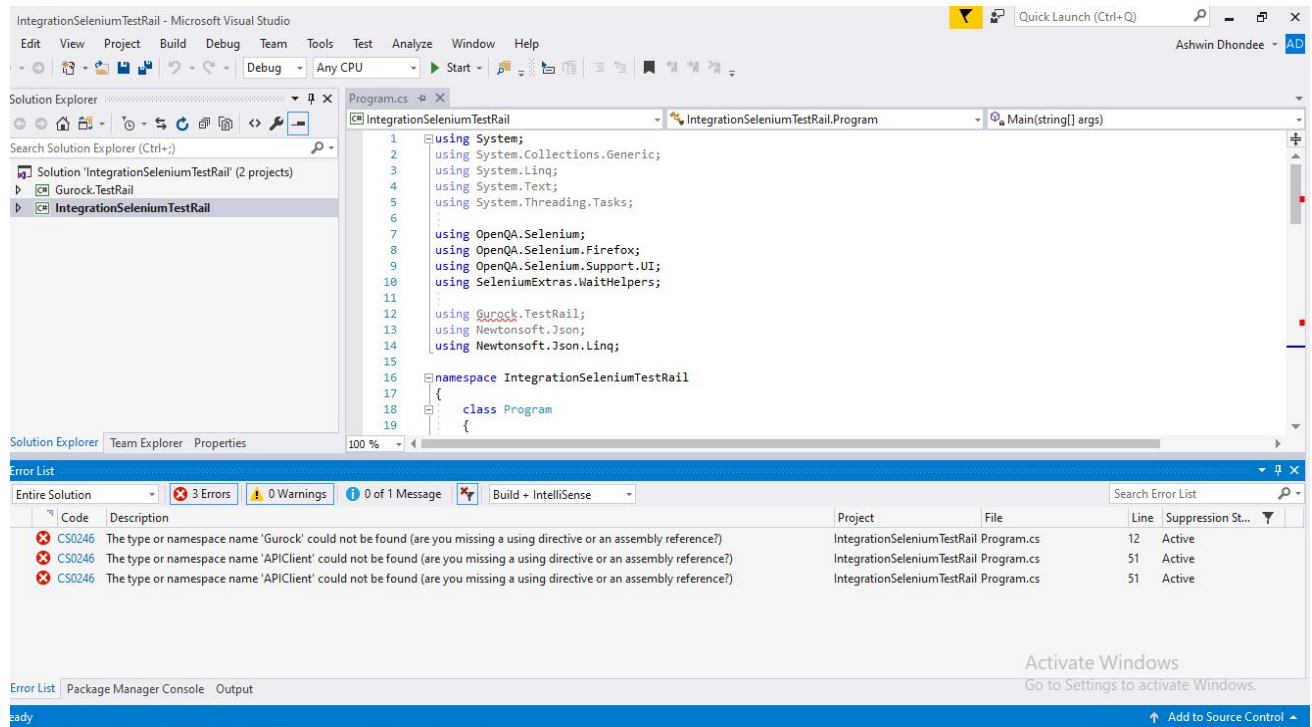

TOSHIBA (E:) > SOFTWARE > testrail-api-master > dotnet >				
Name	Date modified	Type	Size	
 Gurock	4/14/2020 9:14 AM	File folder		
 AssemblyInfo.cs	4/14/2020 9:14 AM	Visual C# Source f...	1 KB	
 Gurock.TestRail.csproj	4/14/2020 9:14 AM	Visual C# Project f...	4 KB	
 readme.md	4/14/2020 9:14 AM	MD File	1 KB	

Error when compiling

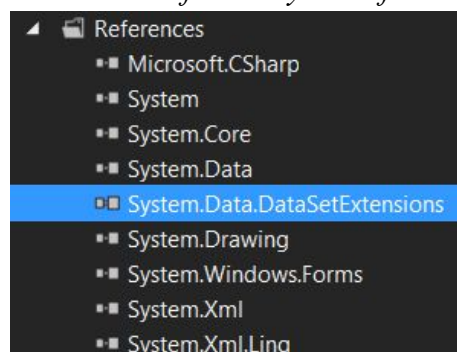

Do the following manipulations:

1.

You probably don't have the System.Configuration.dll added to the project references. It is not there by default, and you have to add it manually.

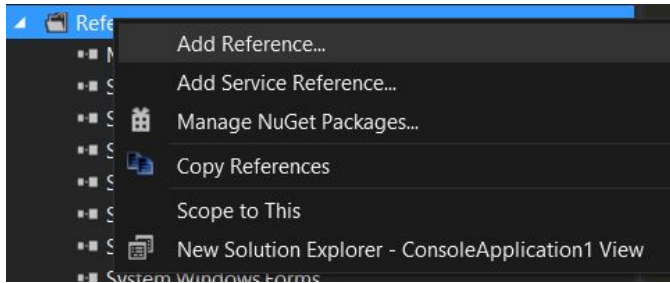

Right-click on the References and search for System.Configuration in the .net assemblies.

*Check to see if it is in your references...*

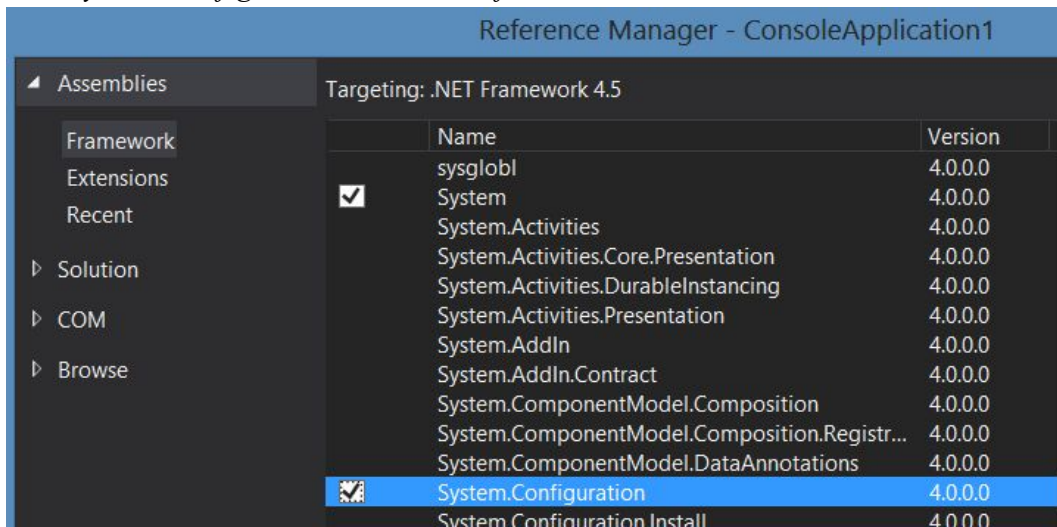

*Right-click and select Add Reference...*

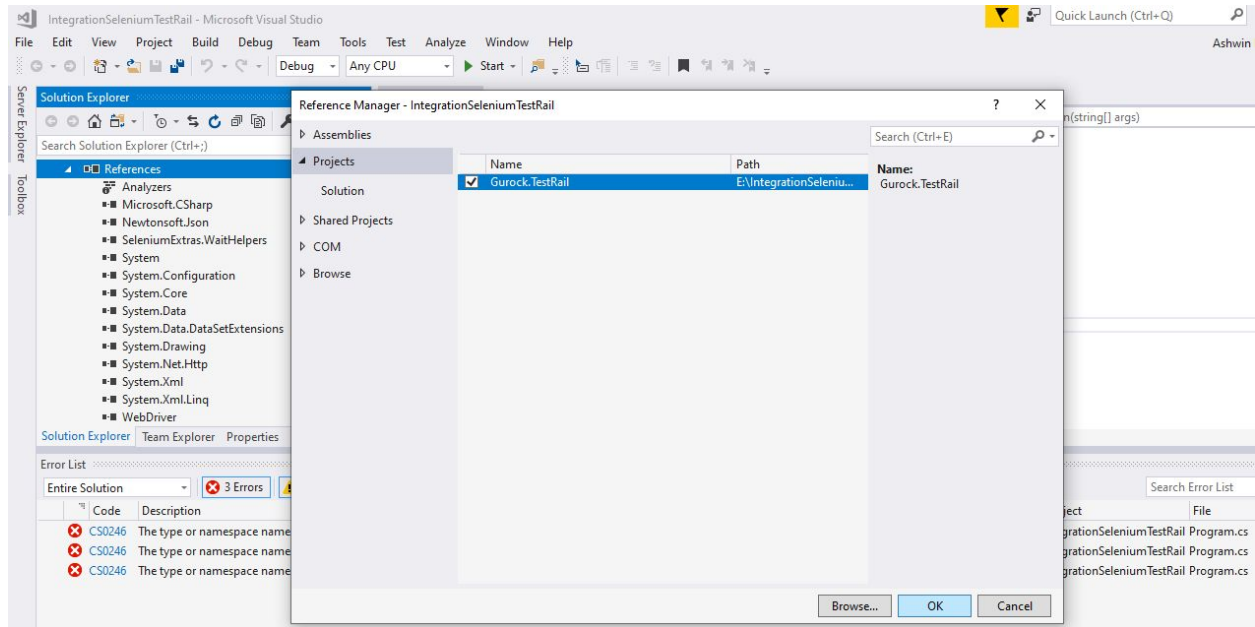

*Find System.Configuration in the list of .Net Assemblies, select it, and click Ok...*

*The assembly should now appear in your references...*

2.

Create a Test Case in Test Rail

It will have id 1 (hardcoded in our code).

Create a Test Run and add our Test Case

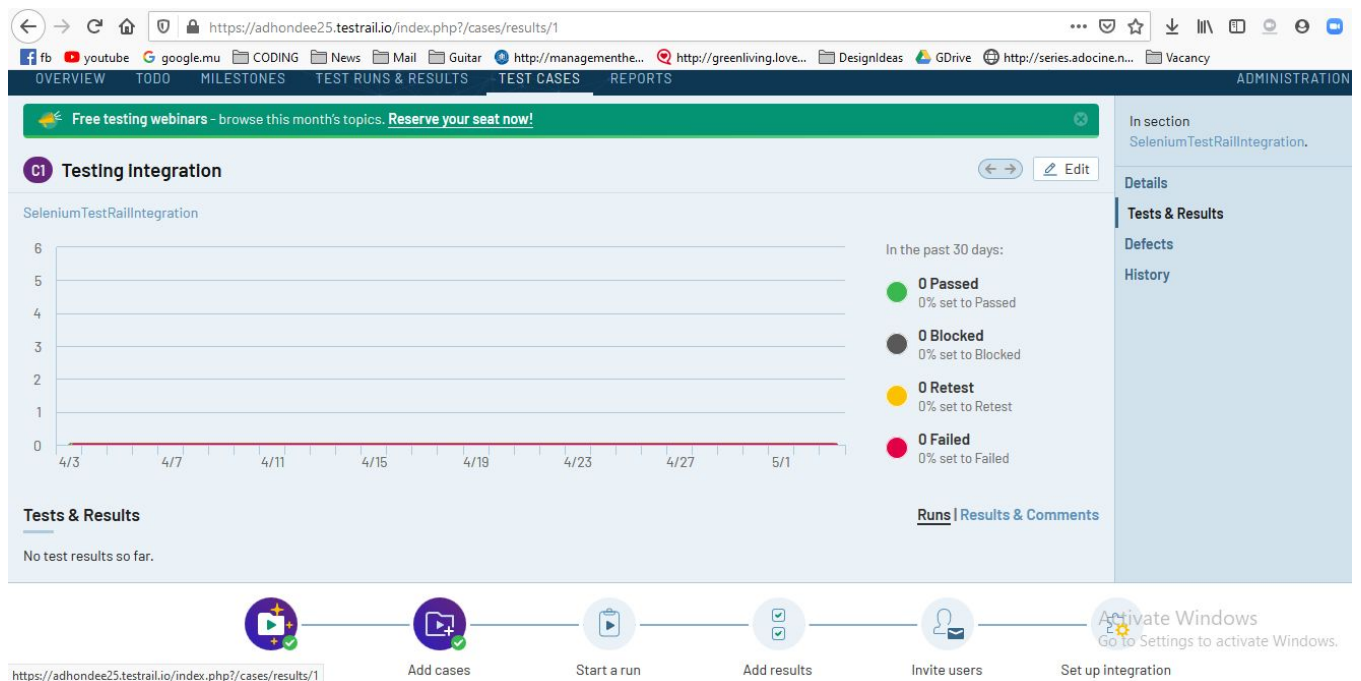

Run code to get title of Test Case

```
APIClient client = new APIClient("https://adhondee25.testrail.io/");
client.User = "adhondee25@gmail.com";
client.Password = "ADHProject2";
Console.WriteLine("Connected to TestRail");
JsonObject c = (JsonObject)client.SendGet("get_case/1");
```

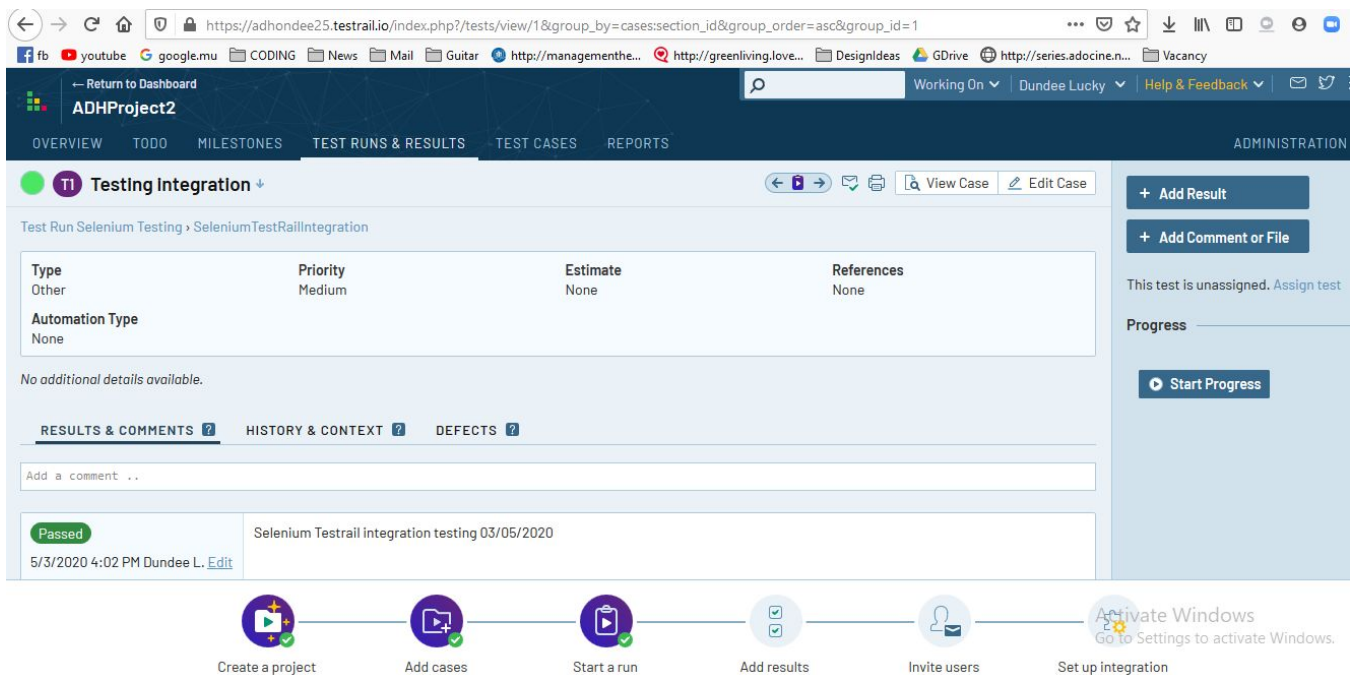

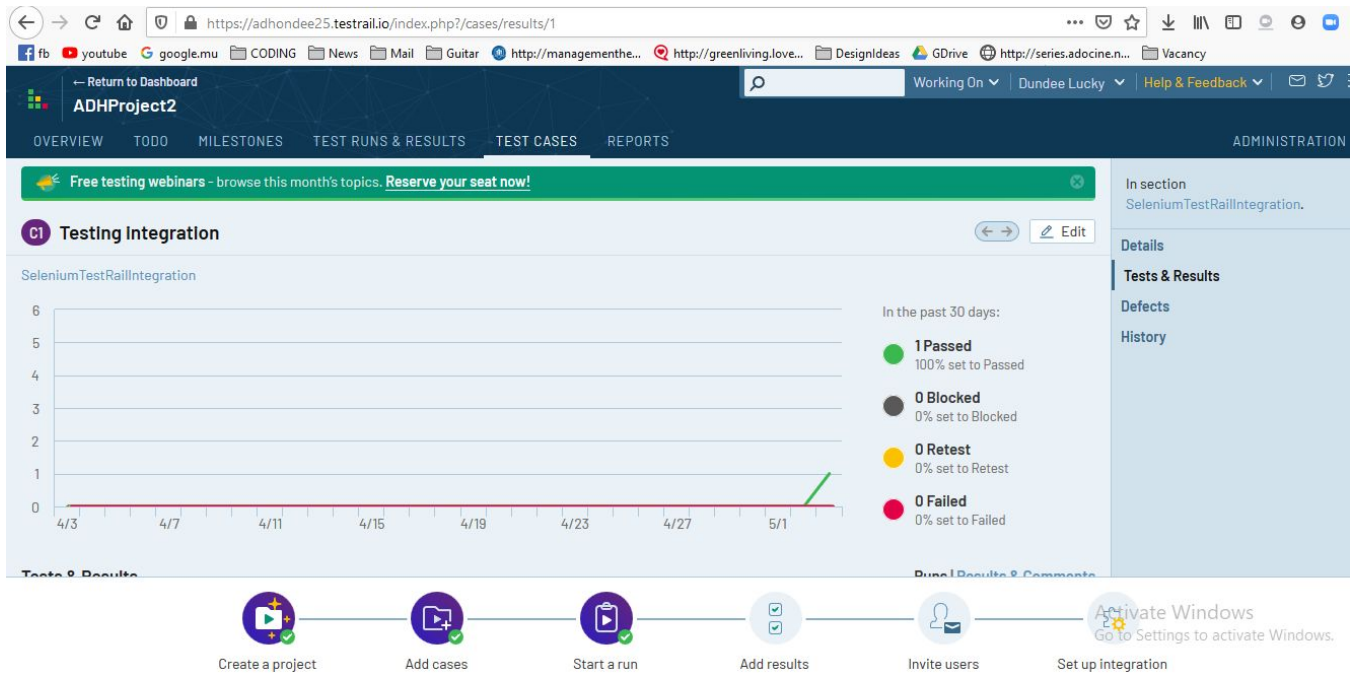

```
Console.WriteLine("Title of Test : " + c["title"]);
```

Test case at start

Run our selenium test

```
E:\IntegrationSeleniumTestRail\IntegrationSeleniumTestRail\bin\Debug\IntegrationSeleniumTestRail.exe
IntegrationSeleniumTestRail
1588521727220  mozrunner::runner  INFO  Running command: "C:\\Program Files\\Mozilla Firefox\\firefox.exe" "-mar
ionette" "-foreground" "-no-remote" "-profile" "C:\\Users\\Dell\\AppData\\Local\\Temp\\rust_mozprofilewxMeEb"
Page title ==Google==
Page title ==cheese - Google Search==
Google search passed.
textContent==Show more==
Connecting to TestRail
Connected to TestRail
Finished writing to TestRail
```

```
if (!testResult)
{
    statusId = 5;
}
Dictionary<string, object> data = new Dictionary<string, object>();
DateTime dateTime= DateTime.Today;
data.Add("status_id", statusId);
data.Add("comment", "Selenium Testrail integration testing "+
dateTime.ToString("dd/MM/yyyy"));
JsonObject r = (JsonObject)client.SendPost("add_result_for_case/1/1", data);
```
